Photos included show the newly implemented core icing method. SC-S189 collected at RM 8.2 E (the SE corner of the Glacier NW Inc. property line) was placed in a 6" dia. PVC pipe. The pipe was then filled with ice up to the mudline (red arrow in photo indicates mudline).

At this time, the entire sediment portion of the core is iced and covered by the piping system.

The Pre-RD is no longer using the utility buckets to stabilize and ice the cores. For future cores, the group will obtain caps for the bottoms and tops of the PVC pipes to help keep the cores cool. For the remainder of the day, the group will continue to replenish the cores with fresh ice until transferring to the warehouse.

Jonni
